Assignment 4: Backend

Exercise (Instructions): HTTPS and Secure Communication

Objectives and Outcomes

In this exercise you will explore the use of the HTTPS server core node module to create and run a secure server. You will also learn about generating your private key and public certificate and use them to configure your Node HTTPS server. At the end of this exercise, you will be able to:

- Configure a secure server in Node using the core HTTPS module
- Generate the private key and public certificate and configure the HTTPS server
- Redirect traffic from the insecure HTTP server to a secure HTTPS server.

Generating Private Key and Certificate

- Go to the *bin* folder and then create the private key and certificate by typing the following at the prompt:

```
1 openssl genrsa 1024 > private.key
2 openssl req -new -key private.key -out cert.csr
3 openssl x509 -req -in cert.csr -signkey private.key -out certificate.pem
```

Note for Windows Users

- If you are using a Windows machine, you may need to install openssl. You can find some openssl binary distributions [here](#). Also, [this article](#) gives the steps for generating the certificates in Windows. Another [article](#) provides similar instructions. Here's an [online](#) service to generate self-signed certificates.

Configuring the HTTPS Server

- Open the *www* file in the *bin* directory and update its contents as follows:

```
1 . . .
2
3 var https = require('https');
4 var fs = require('fs');
5
6 . . .
7
8 app.set('secPort', port+443);
9
10 . . .
11
12 /**
13  * Create HTTPS server.
14  */
15
16 var options = {
17   key: fs.readFileSync(__dirname+'/private.key'),
18   cert: fs.readFileSync(__dirname+'/certificate.pem')
19 };
20
21 var secureServer = https.createServer(options, app);
22
23 /**
24  * Listen on provided port, on all network interfaces.
25  */
26
27 secureServer.listen(app.get('secPort'), () => {
28   console.log('Server listening on port ', app.get('secPort'));
29 });
30 secureServer.on('error', onError);
31 secureServer.on('listening', onListening);
32
33 . . .
```

- Open *app.js* and add the following code to the file:

```
1 . . .
2
3 // Secure traffic only
4 app.all('*', (req, res, next) => {
5   if (req.secure) {
6     return next();
7   }
8   else {
9     res.redirect(307, 'https://' + req.hostname + ':' + app.get('secPort') + req.url);
10  }
11 });
12
13 . . .
```

- Run the server and test.
- Do a Git commit with the message "HTTPS".

Conclusions

In this exercise, you learnt about configuring a secure server using HTTPS protocol in our Express application.

In this exercise, you learn about configuring a secure server running HTTPS protocol in our Express application.
